

## ■ BUCKET DENESTER WITH AUTOMATIC REPLACEMENT OF BUCKET STACKS

Automatic bucket denester with a buffer tank for the feeding of the desired number of stacks. An ideal solution allowing you to automate the production line and minimizes the time the operator spends refilling buckets.

Adjustable to the buckets' diameter and height, equipped with a level detector for the buckets in the storage tube (the buckets dedicated to packing in an automatic cycle). The denester has a smooth regulation at which it feeds buckets. Most often used in automatic or semi-automatic production lines for packing products into buckets.

### KEY BENEFITS:

- gain working time for other activities;
- manual change of a new stack with buckets;
- automate your production;
- increase capacity to 800 pcs. / h.;
- open design = easy maintenance;
- the device can be a part of a technological production line, as well as works independently;
- an operator-friendly system for changing the bucket to a different type;
- the possibility to work with buckets from 1l - 40l.
